Supplementary Fig. 1. Inhibition of cyclic-AMP response element-binding protein (CBP)/β-catenin reduced dermal fibrosis induced by oxazolone (Ox). Expression of S100A4 were examined by immunohistochemistry with anti-S100A4 (original magnification ×200). S100A4 expression, which is controlled by CBP/β-catenin, was increased in Ox-induced dermal fibrosis, and this induction was reduced by the co-administration of ICG-001.
